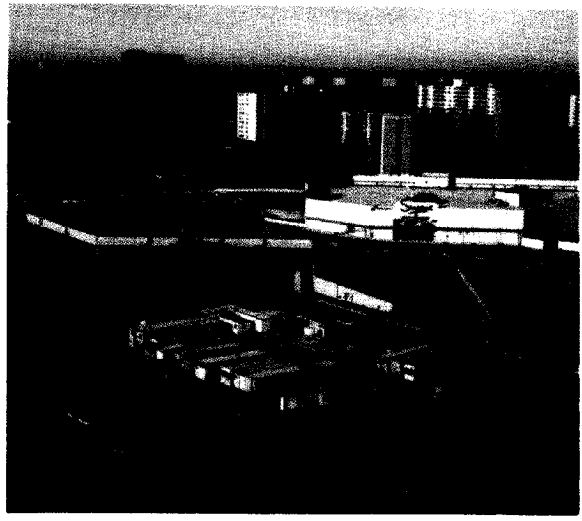
Cast-In-Place
A Flexible Solution

Matching the irregular perimeter of the building, hop-scotching formwork, reinforcement and concrete around the site, and accommodating last minute design, co-ordination and placement dates became day to day routine challenges on the $10 million structure. Co-ordination with respect to site conditions occasioned several adjustments to the deck slope design. While these revisions taxed the design and fabrication ingenuity of the general, formwork, and reinforcing contractors, the Project Team's careful attention to details, combined with tightly coordinated construction schedules, successfully brought it all together – as intended!



Creative Construction scheduling allowed minimum shopper inconvenience. ►

◄ Cast-in-place concrete provided workable and affordable solutions to problems thwarting other systems.
